

Demo Script

PowerPulse — 2-minute demo script

Everything below is reproducible against the build as it stands. No mock screens, no seeded records, nothing that only works if you don't touch it.

Two rules. Record the voiceover separately from the screen capture — room noise kills more hackathon videos than weak content. Burn in subtitles; judges may watch muted.

Before you hit record

Viewport	390 × 844 (Chrome DevTools → iPhone 14). Hide the URL bar in the capture crop.
Window A	Normal window. Profile: Shop . Place: Gisozi, Gasabo .
Window B	Private window. Profile: Remote work . Place: Gisozi, Gasabo .
Language	English. Do the Kinyarwanda question with the RW toggle on.
Reset	Clear cookies to replay the funnel from the landing page.

The clock is pinned with `?at=` so a two-hour maintenance window is live while you film:

<code>/area?at=2026-08-05T12:45</code>	Gisozi — out now, ends 14:00
<code>/chat?at=2026-08-05T12:45</code>	the assistant, same moment
<code>/chat?at=2018-09-18T08:00</code>	Bugarama — the fault with no published end

`?at=` puts a dashed chip at the top of the screen reading **“Showing Wed 5 Aug, 12:45”**. **Leave it visible.** A judge who spots a rigged timestamp you didn't declare stops trusting everything else; a judge who sees you declare it stops worrying. If anyone asks, the record is real and committed — only the clock is moved, so a two-hour window is open while you film.

Shot list

TIME	ON SCREEN	VOICEOVER
0:00–0:12	Landing page. Slow scroll to the three-states block.	“When the power goes out, you want to know three things. Is this planned. How long. And what do I do right now.”
0:12–0:20	Stop on “Three answers, and we mean all three”.	“The utility publishes the first two — in English, in a table a hundred and twenty-six pages long. Nobody sitting in the dark is paging through that.”
0:20–0:34	Tap Get started → tap Shop → Gasabo → Gisozi . Move fast; these are four taps.	“So we built PowerPulse. Tell it who you are, tell it where you are — four taps, no account.”
0:34–0:50	The area screen paints — “Power is out”, the 12:00–14:00 window, the UTEXRWA feeder. Rest on the outage card, then the history stats.	“This is your area, straight from the utility’s own record. Out now, back at two. And underneath, every outage they’ve published here before — with how many records that’s based on.”
0:50–1:04	Tap Ask the assistant . Toggle to RW . Type: <code>nta muriro, mfite inyama muri frigo</code> . Let it answer.	“Ask in your own language. It answers in the same one — and it tells you which record the answer came from.”
1:04–1:14	Point at the source line under the answer. Hold.	“Two hours doesn’t spoil meat. A fridge holds four. So the honest answer here is: keep the door shut, you’re fine.”
1:14–1:32	The money shot . Cut window A and window B side by side, both Gisozi, both 12:45. Highlight the two different advice blocks.	“Same place. Same minute. Same outage. A shop protecting cold stock and someone trying to finish work get different answers — because the advice is generated against the duration and against who’s asking. This is not a lookup table.”
1:32–1:44	Switch place to Bugarama, Rusizi , then <code>/chat?at=2018-09-18T08:00</code> . Ask: <code>when is it back? my fridge is full</code> . Let the answer land.	“And this is the one we’re proudest of. A real fault, in the record, that the utility opened and never closed.”
1:44–1:52	Zoom the <code>duration_line</code> . Hold long enough to read it.	<i>(silent — let them read: “REG has not published a restoration time for this outage. Historical data shows past outages in this area averaged around 3 hours, but this is based on a weak sample of only 3 recorded outages.”)</i>

TIME	ON SCREEN	VOICEOVER
1:52–2:00	Cut to a full-screen card with the eval table.	“We measured that. Thirty-three questions. It never invents a restoration time, and it declines every question it can’t answer. We built it to say ‘I don’t know’.”

Product visible by 0:20. No team intro, no logo animation, no slide preamble.

The closing card

Plain text, high contrast, on screen for the last eight seconds. Numbers only — a judge reads them faster than they hear them.

502 rows scraped · 3,201 records · 126 pages · reg.rw

Location match	28/28
Correct refusals	5/5
Duration-grounded	3/3
Honest with no ETA	3/3
No invented clock time	28/28

Voiceover, clean

Record this straight through, then cut it to picture. ~215 words, comfortable at two minutes.

When the power goes out, you want to know three things. Is this planned. How long. And what do I do right now.

The utility publishes the first two — in English, in a table a hundred and twenty-six pages long. Nobody sitting in the dark is paging through that.

So we built PowerPulse. Tell it who you are, tell it where you are — four taps, no account.

This is your area, straight from the utility’s own record. Out now, back at two. And underneath, every outage they’ve published here before — with how many records that’s based on.

Ask in your own language. It answers in the same one — and it tells you which record the answer came from.

Two hours doesn’t spoil meat. A fridge holds four. So the honest answer here is: keep the door shut, you’re fine.

Same place. Same minute. Same outage. A shop protecting cold stock and someone trying to finish work get different answers — because the advice is generated against the duration and against who’s asking. This is not a lookup table.

And this is the one we’re proudest of. A real fault, in the record, that the utility opened and never closed.

We measured that. Thirty-three questions. It never invents a restoration time, and it declines every question it can't answer. We built it to say "I don't know".

Cut these if you run long

In this order, and no further:

1. The scroll through the three-states block (0:12–0:20) — tighten to 4 seconds.
2. The history stats on the area screen — the outage card alone carries it.
3. The Kinyarwanda food-safety beat (1:04–1:14).

Never cut the two-profile comparison or the no-ETA answer. Those are the two things no other team will have.

Answers to have in one breath

"Why does this need generative AI?" Three places. Messy code-switched input — *"nta muriro mu Kimironko"* has to resolve to a row in a table. Unstructured source text — the utility's area column is hand-written prose with at least five formats. And generated advice — the same outage produces different guidance at thirty minutes than at six hours unknown, and different again for a shop than for a household.

"How do I know it isn't making things up?" Every clock time in an answer has to appear in the data we handed the model, and we score that: 28 out of 28. The model doesn't decide where you are, doesn't compute durations, and doesn't hold the food-safety thresholds — those are in code and in `data/food_safety.json`.

"Only Rwanda?" Rwanda is the MVP because REG publishes openly, which makes it the fastest place to prove the pipeline against real mess. A new country is a new scraper and a new language, not a new product.

"Your sample sizes are tiny." Some of them are, and the product says so out loud. Anything under five records is labelled a weak estimate in the answer itself — that's the Bugarama line.

If the model is down at showtime

The area screen is pure arithmetic over committed records — it paints with no model call at all. Demo the funnel and the record, and show a pre-recorded clip for the assistant. Say plainly that the assistant is a live model call and this one is recorded. Do not fake it live.
